Website Speed and SERP Readiness Audit

Commonwealth Migration Canada

Full site crawl and mobile/desktop performance review | 20 October 2026

Executive Summary

The site is not yet fully optimized for mobile performance or ready to be described as fully SERP-optimized. The live sitemap crawl covered 155 URLs and found a strong technical crawl baseline: each route was reachable after retry, had a self-referencing canonical and one H1, and no missing image alt text or duplicate title/description was detected. But all three sampled mobile PageSpeed reports have LCP above 4 seconds, while Google's good LCP target is 2.5 seconds or faster. The current worktree contains speed changes and builds locally; it has not been deployed, so the live PageSpeed results do not measure those changes.

Dimension	Score	Status	Evidence summary
SEO	7/10	On track with important fixes	Technical crawl signals are consistent; the GTS page has a major topic mismatch and mobile LCP remains poor.
GEO	6/10	Needs focused improvement	Licensed consultant and business identity signals are visible; topic accuracy and source support need editorial review.
AEO	7/10	On track with limits	Question headings and FAQs are present; FAQ markup does not guarantee a Google rich result for this business.

Combined audit judgment: 20/30. The score reflects the audited SEO, GEO and AEO signals; it is not a Google metric.

These are audit judgments, not Google rankings or PageSpeed scores. Search position also depends on relevance, content quality, competition, links, location and other signals. Google describes Core Web Vitals as part of page experience, not a guarantee of ranking.

Highest-priority findings

Mobile LCP: Home 4.1s, CRS calculator 4.8s and blog 4.2s in live lab reports. Each is outside the 2.5s good threshold.

Blog desktop responsiveness: the blog report scored 65 with 1.75s TBT and a 1.51s shared React/runtime task; diagnose the remaining long task after deployment.

Content relevance: the live Global Talent Stream page contains study-permit and post-graduation content under GTS headings. This is a SERP and trust concern; its visible copy needs editorial correction.

Scope and Evidence

The audit used the live production site and its XML sitemap, robots.txt, browser-rendered pages, and Google PageSpeed Insights lab reports captured on 20 October 2026. The sitemap contained 155 URLs. All 155 were reviewed; one route required a retry and then loaded successfully. The route list appears in the Pages Audited appendix.

Performance testing sampled three page families that carry distinct client-side behavior: the homepage, CRS calculator, and blog article. Each has a mobile and desktop PageSpeed report. This is representative template coverage, not a PSI run for every sitemap URL at both device sizes. PageSpeed reported no CrUX field data for these URLs, so the scores below describe lab conditions and do not establish real-user Core Web Vitals.

Signal	Observed result	Assessment
robots.txt	Allows general crawling; disallows /api; points to the XML sitemap.	No accidental sitewide crawl block found.
XML sitemap	155 canonical public URLs.	All sitemap routes were reachable in the crawl after one retry.
Page structure	155/155 self-canonical; 155/155 one H1.	Consistent technical baseline in this crawl.
Image accessibility	0 pages with missing image alt text in the crawl.	No sitewide missing-alt issue detected.
Duplicate metadata	0 duplicate titles; 0 duplicate meta descriptions.	No duplication detected across the sitemap sample.

Mobile and Desktop Performance

The production reports are the baseline. The local implementation has not been deployed, so do not read these numbers as post-optimization results.

Page family	Device	PSI	LCP	FCP	TBT	CLS
Home	Mobile	82	4.1s	2.1s	54ms	0
Home	Desktop	95	0.9s	0.4s	160ms	0.022
CRS calculator	Mobile	75	4.8s	—	260ms	0
CRS calculator	Desktop	99	0.8s	—	90ms	0.02
Blog article	Mobile	80	4.2s	—	70ms	—
Blog article	Desktop	65	1.0s	—	1,750ms	0.001

Interpretation. The captured mobile LCP values are 1.6–2.3 seconds above Google’s good target. Desktop LCP is under one second in these three templates, but the blog has high main-thread blocking. TBT is a lab diagnostic and is not the same metric as field INP.

Homepage diagnostics: PageSpeed estimated about 600ms of render-blocking savings from CSS requests. The mobile LCP breakdown identified roughly 1.87s of render delay, the largest reported phase. The hero image was 39.7 KiB at w=750 and q=75, with about 30 KiB of potential savings estimated by PSI. The desktop report transferred 2.896 MB, recorded 2.2s of main-thread work and five long tasks.

Blog diagnostics: the desktop report recorded eight long tasks; its largest shared React/runtime task was about 1.51s. That points to remaining client-side work after first paint, even though the sampled desktop LCP was 1.0s.

Field-data limitation: PageSpeed showed no field data for the sampled URLs. Search Console and CrUX data are needed to confirm 28-day real-user LCP, INP and CLS by URL group.

Speed Work in the Local Worktree

These changes are in the current local build and have not changed the live production measurements. The latest local Next.js production build succeeded after the original hero photo quality setting was restored.

Area	Local change	Evidence / limitation
Initial JavaScript	Split header interactions, lazy-loaded chatbot and consultation UI, and moved static blog-carousel data out of the client bundle.	Homepage referenced JS gzip: 325.8 KiB to 224.0 KiB (about 31% less). CRS and blog sampled chunks were 230.9 KiB and 193.6 KiB.
Below-fold and data work	Draw history loads only when needed; PNP data is server-provided; TemplateMotion scans newly inserted nodes only.	Less eager client work while preserving existing page structure and interactions.
Image delivery	Use WebP, a 1440px desktop candidate, and high fetch priority for the hero. Hero quality is restored to its original q=60 setting; Next allows q=60 and q=75.	Keeps the original source quality choice while avoiding an oversized desktop candidate on standard desktop slots.
CSS delivery candidate	Next experimental.inlineCss is enabled to address the live render-blocking CSS diagnostic.	Local CSS content hashes matched in inline and external builds for home, PNP and CRS. Gzip HTML rose from about 109.3 KiB to 205.9 KiB while external CSS was about 48.7 KiB gzip; this tradeoff needs post-deploy mobile measurement.
Build scope	The latest Next production build succeeded and generated 187 route entries.	The route count includes generated entries beyond the 155 public sitemap URLs.

Visual Preservation Check

The CSS source itself was not changed by the CSS-delivery optimization; the CSS bytes remained the same in local inline and external build comparisons for homepage, PNP and CRS outputs. The local production rendering was inspected at 390 × 844 and 1440 × 900. The document width did not exceed the viewport at either size, and no horizontal overflow was observed. The hero image quality was restored to the original q=60 code setting before the final build.

This confirms the local responsive layout and delivery-mode check, but it is not a pixel-diff against every production route or every viewport. Full post-deploy visual and PageSpeed comparisons remain necessary before calling the change verified across the complete live site.

Technical SEO and SERP Readiness

Technical crawl signals

The live sitemap and robots directives are accessible. Every crawled URL returned a self-referencing canonical and exactly one H1. No title or description duplicates and no missing image alt attributes were observed in this 155-URL crawl. Page word counts ranged from 650 to 6,813; length alone does not establish quality or relevance.

Metadata length outliers are review prompts, not automatic ranking failures. Seven titles were shorter than 30 characters; fourteen descriptions were under 120 characters; nineteen descriptions exceeded 165 characters. Google may generate different search snippets, so compare impressions and click-through rate in Search Console before rewriting metadata in bulk.

Content relevance and trust

High priority: the live Global Talent Stream page has a major content-topic mismatch. Under GTS headings it describes a Canadian study and post-graduation pathway, directs readers to study-permit guidance, and includes study-permit/post-graduation questions. The route is reachable and its title/canonical are present, but its visible copy does not answer the search intent implied by its title and URL. This requires an editorial correction using current official program sources; no copy change was made as part of the visual-preserving speed work.

GEO and entity signals

The homepage visibly names Pankaj Khanna and displays CICC licence R711256 with a link to the regulator register. The footer exposes business contact details and government/regulator links. Homepage JSON-LD included ProfessionalService, WebSite, Person, WebPage, BreadcrumbList and FAQPage. These signals support entity clarity, but they do not establish rankings or substitute for accurate, original page-level content and citations to controlling sources.

AEO and structured answers

The homepage and service pages use question-style headings and FAQ sections. FAQPage structured data was detected across the sampled pages. Google's published FAQ rich-result guidance limits eligibility primarily to well-known, authoritative government and health sites, so this consultancy should not plan on FAQ markup producing a Google FAQ rich result. Keep markup only where it matches visible page content and validates; structured data does not guarantee display.

Priority Recommendations

Priority	Issue	Area	Next action
Critical	Mobile LCP above 4s on all three sampled page families	Speed	After deployment, rerun PSI for mobile home, CRS, blog and one page per shared service template; identify the actual LCP element and reduce render delay while retaining the design. Target LCP ≤2.5s.
High	Global Talent Stream page contains unrelated study-permit content	SERP / trust	Correct page copy and FAQ against current official GTS sources; recheck title, headings, internal links and structured data after editorial review.
High	Blog desktop TBT 1,750ms and shared task 1.51s	Speed	Profile client chunks and long tasks in the production build; defer non-critical hydration and interaction code without delaying visible content.
High	Inline CSS trades a blocking request for larger HTML	Speed	Measure cold mobile and desktop after deployment. Keep inlineCss only if repeated LCP/paint improvements outweigh added HTML transfer and TTFB.
Medium	Metadata outliers on 7 titles and 33 descriptions	SEO	Review the listed URLs against query intent and Search Console snippets; edit selectively, not to hit a character count.
Medium	No CrUX field data available in sampled PSI reports	Measurement	Use Search Console Core Web Vitals and real-user monitoring after enough traffic accumulates; segment by mobile and shared template.

Implementation sequence

1. Build verified. The final local production build passed after restoring the original hero q=60 setting.

2. Release the local speed changes through the normal deployment process. The present PSI readings describe production before this local build.

3. Measure the same URLs again. Compare mobile and desktop PSI for the home, CRS and blog pages, then add at least one URL for each shared page template. Record LCP element, render delay, transfer size, TBT and CLS.

4. Verify real-user experience. Use Search Console/CrUX when field data is available; check URL groups and mobile-specific problems rather than relying on the performance score alone.

5. Correct content relevance separately. Have an editor validate the GTS page against current official sources; this will change visible text, so it is outside the no-visual-change speed patch.

Google guidance and audit sources

Google does not promise a ranking position from a technical score. Core Web Vitals are one aspect of page experience. Google’s good thresholds are LCP within 2.5 seconds, INP within 200 milliseconds and CLS below

0.1, assessed at the 75th percentile for field data. Lab TBT helps diagnose blocking work but does not replace field INP.

Core Web Vitals thresholds: https://web.dev/articles/vitals

Google Search Central page experience: https://developers.google.com/search/docs/appearance/page-experience

Google Search technical requirements: https://developers.google.com/search/docs/essentials/technical

Google FAQ rich-result guidance: https://developers.google.com/search/blog/2023/08/howto-faq-changes

Google spam policies for scaled content: https://developers.google.com/search/docs/essentials/spam-policies#scaled-content The GTS mismatch is a relevance warning; this audit does not conclude that the site violates policy.
