Technical SEO Audit Report

Commonwealth Migration Group Inc. | 6 November 2026

Conclusion: the production build is technically ready for crawler discovery after remediation. The audit covered the generated route inventory, rendered HTML, crawler directives, structured discovery files, internal links, metadata, headings, image alternatives and blog-content validation. The final crawl returned 200 for all 207 sitemap URLs, and the complete LLM discovery index matches the sitemap exactly.

Executive summary

Area	Final status	Evidence
Crawl discovery	Pass	robots.txt points to sitemap.xml; sitemap has 207 canonical URLs.
Sitemap coverage	Pass	All indexable page registries and 72 blog posts are represented.
LLM discovery	Pass	llms.txt is generated from the route registries; llms-full.txt contains the same 207 URLs.
Rendered HTML	Pass	207/207 returned 200, self-canonical, index/follow, one H1 and complete image alt coverage.
Internal linking	Pass	No internal links in the crawled set resolve through a 3xx redirect.
Content validation	Pass	72/72 blog bodies and FAQ/schema parity checks pass.

Scope and method

The review used the repository's production build rather than relying only on source inspection. Next.js 16.3.0 was built with the project's production command, the generated server was started locally, sitemap URLs were fetched, and each rendered page was checked for crawl status, canonical URL, robots meta, title, description, H1 count, image alt text and duplicate metadata. The audit also checked the live homepage presentation and the public discovery URL set.

The technical audit is not a ranking guarantee. Search performance also depends on page experience, demand, links, competition, freshness and Search Console signals. Those items are listed as ongoing operational checks below.

Issues found and fixed

Finding	Impact	Remediation
Static llms.txt was incomplete and used an older brand label.	AI crawlers had a partial, stale entity and page map.	Replaced it with generated /llms.txt and added generated /llms-full.txt using the same page and blog registries as the sitemap.
Three tool cards linked to redirecting legacy paths.	Internal crawl equity passed through 308 redirects.	Mapped pnp-eligibility, noc-finder and document-checklist aliases directly to their canonical -canada routes.

Finding	Impact	Remediation
Filtered Ontario and PNP views were indexable query variants.	Duplicate parameter pages could compete with the canonical landing pages.	Added noindex, follow for query-filtered variants while preserving the canonical clean URL.
Long source descriptions could exceed a practical search-snippet length.	Search and social metadata was less consistent.	Centralized description normalization at 155 characters with word-boundary clipping.
One 2026 Express Entry article failed content-quality checks.	The article was missing required answer, body, glossary and FAQ depth.	Added concise answer copy, section paragraphs, five glossary terms and three compliant FAQs; all 72 articles now validate.

Final validation results

Check	Result
Sitemap URLs	207
Full LLM index URLs	207; exact set match with sitemap
Sitemap URL HTTP responses	207/207 returned 200
Self-canonical pages	207/207
Index/follow directives	207/207
Exactly one H1	207/207
Missing image alt text	0 pages
Duplicate title tags	0
Duplicate meta descriptions	0
Internal link redirects	0
Query variants	Ontario and PNP filter views return noindex, follow

Implemented source changes

The implementation is centralized so future content additions are less likely to create discovery drift:

- src/lib/seo.js — Normalizes metadata descriptions and removes empty keyword tags.
- src/lib/seoRoutes.js — Shared indexable-route registry used by sitemap and LLM discovery.
- src/lib/llms.js — Generates compact and complete machine-readable page indexes.
- src/app/llms.txt/route.js — Serves the compact discovery file.
- src/app/llms-full.txt/route.js — Serves the complete 207-URL discovery file.
- src/app/sitemap.js — Consumes the shared route registry and keeps noindex destinations out.
- src/config/pageRoutes.js — Prevents three internal tool links from using redirecting paths.
- src/app/ontario-pr/page.js and src/app/pnp-draws/page.js — Noindexes filtered query variants while keeping clean pages indexable.
- src/data/blog-articles/express-entry-oinp-changes-2026.js — Brings the article into the project's answer, glossary, FAQ and section-depth requirements.

Recommended operating checklist

- Submit https://commonwealthmigration.ca/sitemap.xml in Google Search Console and Bing Webmaster Tools after deployment.
- Inspect the production versions of /robots.txt, /sitemap.xml, /llms.txt and /llms-full.txt after each deployment; the new text routes are generated at build time.
- Monitor Search Console for indexing exclusions, duplicate canonical reports, soft 404s, Core Web Vitals and structured-data warnings.
- Keep declared last-modified dates and draw/news data current when source content changes; the sitemap already deduplicates URLs and excludes payment destinations.
- Run a PageSpeed or Lighthouse pass on representative mobile pages. This audit did not measure Core Web Vitals or JavaScript interaction performance.

Public discovery endpoints

LLM full index: https://commonwealthmigration.ca/llms-full.txt

Limitations

This report assesses technical crawl readiness and the repository's generated output. It does not certify legal or immigration-content accuracy, guarantee search rankings, measure server latency from each country, or replace live Search Console and analytics data. The final deployment should use the same environment variables and public hostname tested in the metadata configuration.
