CONTENT ORIGINALITY & SEARCH READINESS

Website content review

Scope: commonwealthmigration.ca source content · 199 sitemap routes · review date: 26 October 2026

Can the site be certified 100% plagiarism-free? No. This review does not use a comprehensive similarity database, and no finite web search can prove that every sentence is unique against every published or private source. The work reduces avoidable duplication and checks samples; it is not a plagiarism certificate.

What was reviewed

- Rendered page inventory: 199 routes from the local sitemap. A full route and metadata crawl completed before the final copy-context edits; it checked HTTP status, title, meta description, canonical, H1 and main content.
- Content sources: service pages, six Markdown-backed pages, city landing pages, provincial and territorial pathway guides, FAQ/schema pairs, blog article bodies, supporting page templates and related-content cards.
- Search originality: exact-phrase web searches sampled distinctive passages. No verbatim result surfaced in those samples. Search coverage was not exhaustive, and search engines do not index every source.
- Internal duplication: the first sitewide scan flagged 238 repeated paragraph groups. Most were shared brand copy, route notices, local FAQs, source guidance and article-card excerpts. These findings indicate reuse within the site, not external plagiarism by themselves.

Content work completed

- Removed artificial SEO word-count padding that expanded pages with repeated generic prose; the authored route content now carries the page guidance.
- Reworked outdated or shallow pathway explanations with route-specific material, preserving each section’s purpose and grounding immigration claims in government or provincial sources.
- Replaced generic service and article-template copy with topic-aware introductions, next-step guidance and calls to action. Location FAQs now identify the city while keeping federal eligibility rules consistent.
- Kept visible FAQ answers synchronized with structured FAQ data. Deleted filler was replaced with practical checks, evidence examples, deadlines and next actions where the page needed them.

Validation and responsive review

Check	Result
Page data validator	6 Markdown page files and 6 route records validated.
Blog validator	65/65 published article bodies validated; 1,714 minimum, 2,103 average and 2,860 maximum words.
FAQ parity	659 visible FAQ questions and answers match structured FAQ data across 65 articles.
ESLint and diff checks	Changed JavaScript files passed ESLint; git diff --check passed.
Playwright after final copy edits	30 checks: 10 representative route types at 390, 768 and 1,440 px. No route failures, missing H1s, horizontal overflow, page errors or console errors.
Visual inspection	Reviewed a mobile homepage and desktop article hero screenshot; the edited copy fit existing components without changing layout structure.

Coverage limits

- The 199-route crawl was not repeated to completion after the last copy-only adjustments. The attempted isolated rerun exhausted temporary build storage while compiling the larger route list; its timeout and server errors are not treated as page defects. The final copy changes received targeted Playwright coverage across the affected templates.
- A similarity scan still needs a licensed plagiarism or web-matching service that can compare the final rendered site against a broad corpus. Any flagged passage should be reviewed for quotation, standard legal language, official terminology and properly attributed facts before rewriting.
- The edits are in the local workspace and have not been deployed. Live search results, rankings, snippets and AI-generated answers will change over time; this work cannot guarantee SERP or AEO positions.

Recommended final publication checks

1. Run the final rendered copy through an organization-approved similarity checker and manually review every meaningful match.
2. After deployment, crawl the live sitemap and confirm canonical URLs, indexability, FAQ output and mobile rendering against production.
3. Review Search Console impressions, queries and indexing over time, then update passages when official program rules change.
